

## **Laser Surgery**

### **What is laser surgery?**

Instead of using the traditional scalpel to make the incision, The laser uses an intense beam of laser light, which minimizes pain, swelling, and bleeding often associated with surgery.

### **How does laser surgery work?**

The laser has the ability to “erase” the tissue. It seals nerve endings, so patients are in less pain after surgery and usually have a more comfortable time waking up. The laser also seals the lymphatics, which cuts down the post-operative swelling.

### **Advantages of laser surgery**

Less pain, swelling, and discomfort are the major advantages of using laser surgery.

- Less pain and swelling promote a quicker recovery.
- Less bleeding simplifies surgery, and may reduce the need for anesthesia.
- Sanitizing effect of the laser beam reduces the risk of infection.
- Less trauma for your pet.
